# GATE PREVIOUS YEAR SOLVED PAPERS

Electronics & Telecommunications Previous Year Solved Papers

**GATEFORUM** Pioneers in Digital courses for GATE since 2008 has long history of training students through innovative courses. Currently GATEFORUM offers a wide range of courses from eGATE, GATE Online, Gdrive to Online TarGATE. Since inception, we have trained more 3,00,000 students since inception.

5. A speech signal, band limited to 4 kHz, is sampled at 1.25 times the Nyquist rate. The speech samples, assumed to be statistically independent and uniformly distributed in the range -5V to +5V, are subsequently quantized in an 8-bit uniform quantizer and then transmitted over a voice-grade AWGN telephone channel. If the ratio of transmitted signal power to channel noise power is 26 dB, the minimum channel bandwidth required to ensure reliable transmission of the signal with arbitrarily small probability of transmission error (rounded off to two decimal places) is kHz.

6. Consider the circuit with an ideal OPAMP shown in the figure.

Assuming  $|V_{IN}| \ll |V_{CC}|$  and  $|V_{REF}| \ll |V_{CC}|$ , the condition at which  $V_{OUT}$  equals to zero is

| (A)     | $V_{IN} = 0.5 V_{REF}$ | (B) $V_{IN} = 2 + V_{REF}$ | (C) $V_{IN} = 2V_{REF}$ | (D) $V_{IN} = V_{REF}$  |
|---------|------------------------|----------------------------|-------------------------|-------------------------|
| Answer: | (D)                    |                            | Click here to           | watch video explanation |

7. A bar of silicon is doped with boron concentration of  $10^{16}$  cm<sup>-3</sup> and assumed to be fully ionized. It is exposed to light such that electron-hole pairs are generated throughout the volume of the bar at the rate of  $10^{20}$  cm<sup>-3</sup>s<sup>-1</sup>. If the recombination lifetime is 100 µs, intrinsic carrier concentration of silicon is  $10^{10}$  cm<sup>-3</sup> and assuming 100% ionization of boron, then the approximate product of steady-state electron and hole concentrations due to this light exposure is

 (A)  $10^{20} \text{ cm}^{-6}$  (B)  $2 \times 10^{20} \text{ cm}^{-6}$  (C)  $10^{32} \text{ cm}^{-6}$  (D)  $2 \times 10^{32} \text{ cm}^{-6}$  

 Answer:
 (D)
 (D)
 (D)
 (D)

8. The refractive indices of the core and cladding of an optical fiber are 1.50 and 1.48, respectively. The critical propagation angle, which is defined as the maximum angle that the light beam makes with the axis of the optical fiber to achieve the total internal reflection, (rounded off to two decimal places) is \_\_\_\_\_ degree.

Answer: (9.36)

1.2 μm

The magnitude of reverse bias voltage that would completely deplete one of the two regions (P or N) prior to the other (rounded off to one decimal place) is \_\_\_\_\_\_V.

43. The impedance matching network shown in the figure is to match a lossless line having characteristics impedance  $Z_0 = 50\Omega$  with a load impedance  $Z_L$ . A quarter-wave line having a characteristic impedance  $Z_1 = 75\Omega$  is connected to  $Z_L$ . Two stubs having characteristic impedance of  $75\Omega$  each are connected to this quarter-wave line. One is a short-circuited (S.C) stub of length 0.25 $\lambda$  connected across PQ and the other one is an open-circuited (O.C) stub of length 0.5 $\lambda$  connected across RS.

**48.** The propagation delay of the exclusive-OR (XOR) gate in the circuit in the figure is 3 ns. The propagation delay of all the flip-flops is assumed to be zero. The clock (Clk) frequency provided to the circuit is 500 MHz.

Starting from the initial value of the flip-flop outputs  $Q_2Q_1Q_0 = 111$  with  $D_2 = 1$ , the minimum number of triggering clock edges after which the flip-flop outputs  $Q_2Q_1Q_0$  becomes 100 (in integer) is \_\_\_\_\_.

**Answer:** (5)

**EC-GATE-2021 WWW.gateforumonline.com 49.** The content of the registers are  $R_1 = 25H$ ,  $R_2 = 30H$  and  $R_3 = 40H$ . The following machine instructions are executed. PUSH $\{R_1\}$ PUSH $\{R_2\}$ PUSH $\{R_3\}$ POP $\{R_1\}$ POP $\{R_1\}$ POP $\{R_3\}$ 

After execution, the content of registers  $R_1, R_2, R_3$  are

(A)  $R_1 = 30H, R_2 = 40H, R_3 = 25H$ (B)  $R_1 = 25H, R_2 = 30H, R_3 = 40H$ (C)  $R_1 = 40H, R_2 = 30H, R_3 = 25H$ (D)  $R_1 = 40H, R_2 = 25H, R_3 = 30H$ 

Answer: (C)

50. An asymmetrical periodic pulse train  $v_{in}$  of 10V amplitude with on-time  $T_{ON} = 1$  ms and off-time  $T_{OFF} = 1 \,\mu s$  is applied to the circuit shown in the figure.

The difference between the maximum voltage and minimum voltage of the output waveform  $v_0$  (in integer) is \_\_\_\_\_\_V.

Answer: (10)

51. The circuit in the figure contains a current source driving a load having an inductor and a resistor in series, with a shunt capacitor across the load. The ammeters is assumed to have zero resistance. The switch is closed at time t = 0.

Initially, when the switch is open, the capacitor is discharged and the ammeter reads zero ampere. After the switch is closed, the ammeter reading keeps fluctuating for some till it settles to a final steady value. The maximum ammeter reading that one will observe after the switch is closed (rounded off to two decimal places) is \_\_\_\_\_\_A.

**52.** The complete Nyquist plot of the open-loop transfer function G(s)H(s) of a feedback control system is shown in the figure.

If G(s)H(s) has one zero in the right-half of the s-plane, the number of poles that the closed-loop system will have in the right-half of the s-plane is

| (A) 1       | (B) 3 | (C) 4         | (D) 0                   |
|-------------|-------|---------------|-------------------------|
| Answer: (B) |       | Click here to | watch video explanation |

53. A unity feedback system that uses proportional-integral (PI) control is shown in the figure.

The stability of the overall system is controlled by tuning the PI control parameters  $K_p$  and  $K_I$ . The maximum value of  $K_I$  that can be chosen so as to keep the overall system stable or, in the worst case, marginally stable (rounded off to three decimal places) is \_\_\_\_\_.

**Answer:** (3.125)
