- 8. P,Q,R,S,T,U,V, and W are seated around a circular table.
  - (i) S is seated opposite to W.
  - (ii) U is seated at the second place to the right of R.
  - (iii) T is seated at the third place to the left of R.
  - (iv) V is a neighbor of S.

Which of the following must be true?

- (A) P is not seated opposite to Q
- (B) R is the left neighbor of S

(C) Q is a neighbor of R.

(D) P is a neighbor of R

Answer: (A)

GATEFORUM

9. Repo rate is the rate at which Reserve Bank of India (RBI) lends commercial banks, and reverse repo rate is the rate at which RBI borrows money from commercial banks.

Which of the following statements can be inferred from the above passage?

- (A) Decrease in reportate will decrease cost of borrowing and increase lending by commercial banks.
- (B) Decrease in reportate will increase cost of borrowing and decrease lending by commercial banks.
- (C) Increase in reportate will decrease cost of borrowing and decrease lending by commercial banks.
- (D) Increase in reportate will increase cost of borrowing and Increase lending by commercial banks.

Answer: (A)

10. The distance between Delhi and Agra is 233km. A car P started travelling from Delhi to Agra and another car Q started from Agra to Delhi along the same road 1 hour after the car P started. The two cars crossed each other 75 minutes after the car Q started. Both cars were travelling at constant speed The speed of car P was 10km/hr more than the speed of car Q. How many kilometers the car Q had travelled when the cars crossed each other?

(A) 116.5	(B) 88.2	(C) 66.6	(D) 75.2

6. Consider the hyperbolic function in Group -1 and their definition in Group -2

Group -1	Group - 2
( <b>P</b> ) tanh.x	(I) $\frac{e^{x} + e^{-x}}{e^{x} - e^{-x}}$
(Q) coth.x	$(\mathbf{II})  \frac{2}{\mathbf{e}^{\mathbf{x}} + \mathbf{e}^{-\mathbf{x}}}$
( <b>R</b> ) sech.x	(III) $\frac{2}{e^{x}-e^{-x}}$
(S) cosech.x	( <b>IV</b> ) $\frac{e^{x} - e^{-x}}{e^{x} + e^{-x}}$

The correct combination is

(A) P-II, Q-III, R-I, S-IV

- $(B) \qquad P-IV, Q-I, R-II, S-III$
- (C) P-II, Q-III, R-I, S-IV
- (D) P-IV, Q-I, R-III, S-II

#### Answer: (B)

7. Consider a batch distillation process for an equimolar mixture of benzene and toluene at atmospheric pressure. The mole fraction of benzene in the distillate collected after 10 minutes si 0.6. The process is further continued for additional 10 minutes. The mole fraction of benzene in the total distillate collected after 20 minutes of operation is

- (A) exactly equal to 0.7
- (C) exactly equal to 0.6

- (B) greater than 0.7
- (D) less than 0.6

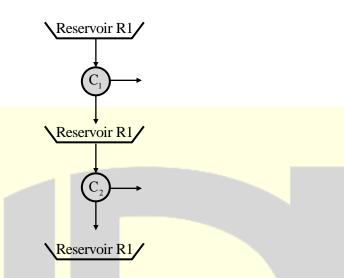

\_\_\_\_\_

Answer: (D)

Plug flow reactor R = 1			$\begin{array}{c} \\ \\ \\ \\ \\ \\ \\ \\ \\ \\ \\ \\ \\ \\ \\ \\ \\ \\ \\$
	Plug flow reactor R =1		$E(t),s^{-1}$

www.gateforumonline.com

In addition, use the following data and assumptions

- R is defined as ratio of the volume of fluid returned to the entrance of the reactor to the volume leaving the system
- No reaction occurs in the reactor
- Ignore any dead volume in the recycle loop

If the space time of the plug flow reactor is  $\tau$  seconds, which one of the following is correct?

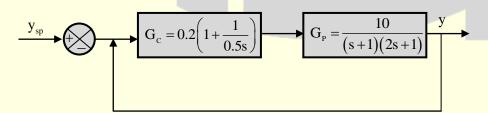

(A) 
$$t_1 = \frac{\tau}{3}, t_2 = \frac{2\tau}{3}, t_3 = \tau, t_4 = \frac{4\tau}{3}$$
  
(B)  $t_1 = \tau, t_2 = 2\tau, t_3 = 3\tau, t_4 = 4\tau$   
(C)  $t_1 = \frac{\tau}{2}, t_2 = \frac{\tau}{4}, t_3 = \frac{\tau}{8}, t_4 = \frac{\tau}{16}$   
(D)  $t_1 = \frac{\tau}{2}, t_2 = \tau, t_3 = \frac{3\tau}{2}, t_4 = 2\tau$ 

Answer: (D)

- **20.** The operating temperature range for the Haber process is 350-500°C. It is used for the production of ammonia at
  - (A) 20 MPa using zeolite catalyst in an endothermic reaction
  - (B) 0.1 MPa using Fe catalyst in an exothermic reaction
  - (C) 20 MPa using Fe catalyst in an exothermic reaction
  - (D) 20 MPa using Fe catalyst in an endothermic reaction

Answer: (C)

21. Consider the following closed loop system with  $G_{P}$  and  $G_{C}$  as the transfer functions of the process and the controllers, respectively.

For a unit step change in the set point  $(y_{sp})$ , the change in the value of the response (y) at steady state is \_\_\_\_\_(round off to 1 decimal place).

#### Answer: (1)

bı	racketing) to obtain the solution of f	f(x)=0, where $f(x)$ is a continuous nor	n-linear algebraic function?
(4	A) Newton-Raphson method	(B) Secant method	
(0	C) Regula falsi method	(D) Fixed point iterati	on method
Answer 23. W	: (C) Which one of the following is NOT C	ORRECT?	
(A	A) high density polyethylene (HDI	PE) is produced by condensation polyr	merization
(E	B) poly (ethylene terephthalate) (P	ET) is a polyester	
(0	C) phenol-formaldehyde resin is a	thermosetting polymer	

(D) nylon-6,6 is produced by condensation polymerization

Answer: **(A)** 

The decomposition of acetaldehyde (x) to methane and carbon monoxide follows four-step free radical 24. mechanism. The overall rate of decomposition of X is

$$-\mathbf{r}_{x} = \mathbf{k}_{2} \left(\frac{\mathbf{k}_{2}}{2\mathbf{k}_{3}}\right)^{\frac{1}{2}} \mathbf{C}_{x}^{3/2} = \mathbf{k}_{\text{overall}} \mathbf{C}_{x}^{3/2}$$

Where,  $k_1, k_2$ , and  $k_3$  denote the rate constants of the elementary steps, with corresponding activation energies (in kJ mol<sup>-1</sup>) of 320, 40, and 0, respectively. The temperature dependency of the rate constants is described by Arrhenius equation.  $C_x$  denotes the concentration of acetaldehyde. The rate constant for the overall reaction is  $k_{overall}$ . The activation energy for the overall reaction (in kJ mol<sup>-1</sup>) is \_\_\_\_\_(round off to nearest integer).

(200)Answer:

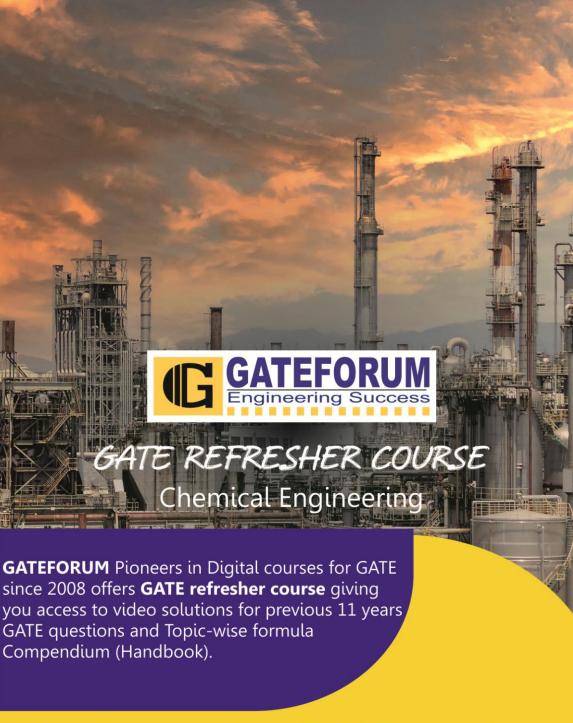

2 4 6 Sum of the eigen values of the matrix 3 5 9 is \_\_\_\_\_(round off to nearest integer). 12 1 7

### Q. No. 26 - 55 Carry Two Marks Each

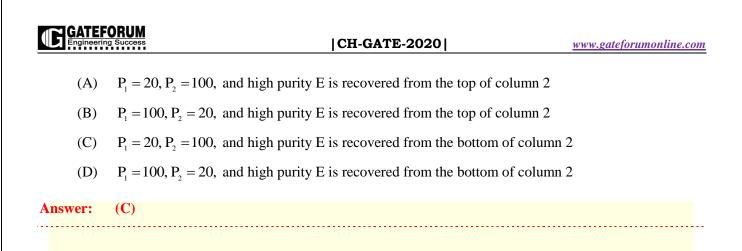

26. Equilibrium data for a binary mixture of E and F at two different pressures is shown in the figure.

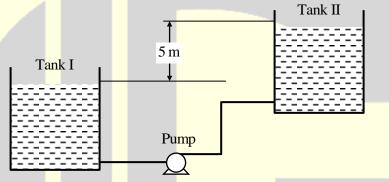

It is desired to process a feed containing 80 mol% E and 20 mol% F, and obtain a product with a purity of 99.5 mol% E. A sequence of two distillation columns, one operating at pressure  $P_1$  and another at  $P_2$ , is employed for this operation, as shown below.

Mole fraction of E in the distillate obtained from column 1 is 0.9. If the column pressures  $P_1$  and  $P_2$  are in kPa, which one of the following is correct?

27. Liquid water is pumped at a volumetric flow rate of  $0.02 \text{ m}^3 \text{s}^{-1}$  from tank I to tank II, as shown in the figure.

Both the tanks are open to the atmosphere. The total frictional head loss for the pipe system is 1.0 m of water.

In addition, use the following data and assumptions

- Density of water is 1000 kg m<sup>-3</sup>
- Acceleration due to gravity is 9.81 m s<sup>-2</sup>
- Efficiency of the pump is 100%
- The liquid surfaces in the tanks have negligible velocities

The power supplied (in W) by the pump to lift the water is \_\_\_\_\_(round of to 1 decimal place).

## Answer: (1177.2)

28. An exothermic, aqueous phase, irreversible, first order reaction,  $Y \rightarrow Z$  is carried out in an ideal continuous stirred tank reactor (CSTR) operated adiabatically at steady state. Rate of consumption of Y (in mol liter<sup>-1</sup> minute<sup>-1</sup>) is given by

$$-r_{_{\rm Y}} = 10^9 e^{-\frac{6500}{T}} C_{_{\rm Y}}$$

Where  $C_{y}$  is the concentration of Y (in mol liter<sup>-1</sup>), and T is the temperature of the reaction mixture

(in K). Reactant Y is fed at 50°C. Its inlet concentration is 1.0 mol liter<sup>-1</sup>, and its volumetric flow rate is 1.0 liter minute<sup>-1</sup>.

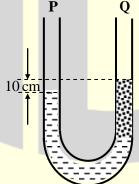

In addition, use the following data and assumptions

- Heat of the reaction  $= -42000 \text{ J mol}^{-1}$
- Specific heat capacity of the reaction mixture =  $4.2J g^{-1}K^{-1}$
- Density of the reaction mixture =  $1000 \text{ g liter}^{-1}$
- Heat of the reaction, specific heat capacity and density of the reaction mixture do not vary with temperature
- Shaft work is negligible

If the conversion of Y at the exit of the reactor is 90%, the volume of the CSTR (in liter) is \_\_\_\_\_ (round off to 2 decimal places).

#### **Answer:** (2.86)

29. A U-tube manometer contains two manometric fluids of densities  $1000 \text{ kg m}^{-3}$  and  $600 \text{ kg m}^{-3}$ . When both the limbs are open to atmosphere, the difference between the two levels is 10 cm at equilibrium, as shown in the figure.

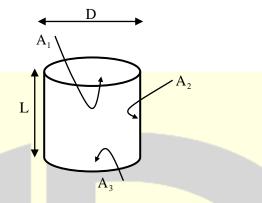

The rest of the manometer if filled with air of negligible density. The acceleration due to gravity is 9.81 m s<sup>-2</sup> and the atmospheric pressure is 10 kPa. How much absolute pressure (in kPa) has to be applied on the limb 'P' to raise the fluid in the limb 'Q' by another 20 cm?

(A) 547.231 (B) 103.924 (C) 833.206 (D) 100.175

#### Answer: (B)

**30.** A hollow cylinder of equal length an inner diameter (i.e., L=D) is sealed at both ends with flat plate, as shown in the figure. Its inner surfaces,  $A_1$ ,  $A_2$ , and  $A_3$  radiate energy.

 $F_{ij}$  denotes the fraction of radiation energy leaving the surface  $A_i$  which reaches the surface  $A_j$ . It is also known that  $F_{i3} = 3 - 2\sqrt{2}$ . which one of the following is correct?

(A)  $F_{21} = \frac{\sqrt{2}-1}{8}$  (B)  $F_{21} = \frac{\sqrt{2}-1}{4}$  (C)  $F_{21} = \sqrt{2}-1$  (D)  $F_{21} = \frac{\sqrt{2}-1}{2}$ 

#### Answer: (D)

**31.** A fluid is heated from 40°C to 60°C in a countercurrent, double pipe heat exchanger. Hot fluid enters at 100°C and exits at 70°C. The log mean temperature difference, i.e. LMTD (in °C), is \_\_\_\_\_(round off to 2 decimal places).

#### **Answer:** (34.76)

- 32. A catalytic gas phase reaction  $P \rightarrow Q$  is conducted in an isothermal packed bed reactor operated at steady state. The reaction is irreversible and second order with respect to the reactant P. The feed is pure P with a volumetric flow rate of 1.0 liter minute<sup>-1</sup> and concentration of 2.0 mol liter<sup>-1</sup>.
  - In addition, use the following assumptions
  - The reactant and product area ideal gases
  - There is no volume change associated with the reaction
  - Ideal plug flow conditions prevail in the packed bed

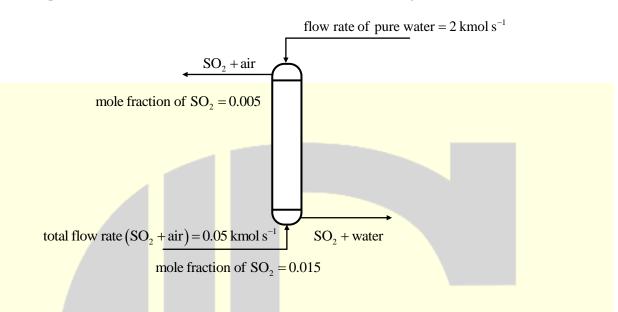

When the mass of catalyst in the reactor is 4 g, the concentration of P measured at the exit is 0.4 mol
liter <sup>-1</sup> . The second order rate constant (in liter <sup>2</sup> $g_{catalyst}^{-1}$ mol <sup>-1</sup> minute <sup>-1</sup> ) is(correct up to one
decimal place).

Flow of water through an equal percentage valve is 900 liter h<sup>-1</sup> at 30% opening, and 1080 liter h<sup>-1</sup> at 35% opening. Assume that the pressure drop across the valve remains constant. The flow rate (in liter h<sup>-1</sup>) through the valve at 45% opening is \_\_\_\_\_ (round off to nearest integer).
Answer: (1555)

**43.** Ina box, there are 5 green balls and 10 blue balls. A person picks 6 balls randomly. The probability that the person has picked 4 green balls and 2 blue balls is

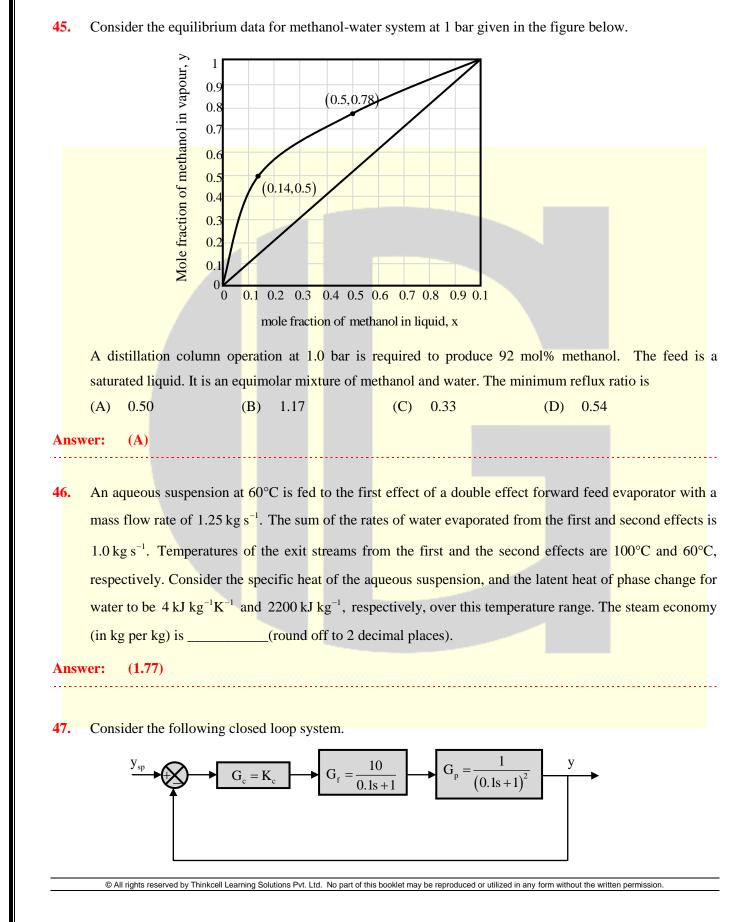

**44.** Consider one mole of an ideal gas in a closed system. It undergoes a change in state form L to N through two different non-isothermal processes, as shown in the P-V diagram (where P is the pressure and V is the molar volume of the gas).

Process I is carried out in a single step, namely LN, whereas process II is carried out in two steps, namely LM and MN. All the steps are reversible.

(A) 500 (B) 1000 (C) 250 (D) 1500

 $G_c$ ,  $G_f$ , and  $G_p$  are the transfer functions of the controller, the final control element and the process, respectively. y and  $y_{sp}$  are the response and its set point, respectively. For a gain margin of 1.6, the design value of  $K_c$  is \_\_\_\_\_ (correct up to one decimal place).

**Answer:** (0.5)

**48.** A vertically held packed bed has a height of 1m, and a void fraction of 0.1, when there is no flow through the bed. The incipient (minimum) fluidization is set in by injection of a fluid of density  $1 \text{kg m}^{-3}$ . The particle density  $(\rho_p)$  of the solids is 3000 kg m<sup>-3</sup>. Acceleration due to gravity is 9.81 m s<sup>-2</sup>. The pressure drop (in Pa) across the height of the bed is \_\_\_\_\_\_ (round off to nearest integer).

**Answer:** (26478.17)

**49.** A pure gas has obeys the equation of state given

$$\frac{PV}{RT} = 1 + \frac{BP}{RT}$$

Where P is the pressure, T is the absolute temperature, V is the molar volume of the gas, R is the universal gas constant, and B is a parameter independent of T and P. The residual molar Gibbs energy,  $G^{R}$ , of the gas is given by the relation.

$$\frac{\mathbf{G}^{\mathsf{R}}}{\mathbf{R}\mathbf{T}} = \int_{0}^{\mathsf{P}} (\mathbf{Z} - 1) \frac{\mathrm{d}\mathbf{P}}{\mathbf{P}}$$

Where Z is the compressibility factor and the integral is evaluated at constant T. If the value of B is  $1 \times 10^{-4} \text{ m}^3 \text{mol}^{-1}$ , the residual molar enthalpy (in J mol<sup>-1</sup>) of the gas at 1000 kPa and 300K is

(A) 300 (B) 2494 (C) 100 (D) 30000

Answer:	( <b>C</b> )	
	$\langle - \rangle$	

50. An elementary liquid phase reversible reaction  $P \rightleftharpoons Q$  is carried out in an ideal continuous stirred tank reactor (CSTR) operated at steady state. The rate of consumption of P,  $-r_p$  (in mol litre<sup>-1</sup> minute<sup>-1</sup>), is given by

$$-r_{p} = C_{p} - 0.5C_{Q}$$

Where  $C_P$  and  $C_Q$  are the concentration (in mol liter<sup>-1</sup>) of P and Q, respectively.

The feed contains only the reactant P at a concentration of 1 mol liter<sup>-1</sup>, and the conversion of P at the exist of the CSTR is 75% of the equilibrium conversion. Assume that there is no volume change associated with the reaction, and the temperature of the reaction mixture is constant throughout the operation. The space time (in minutes) of the CSTR is \_\_\_\_\_(round off to 1 decimal place).

#### Answer: (2)

<u>GATEFORUM</u>

**51.** Consider the following dataset.

x	1	3	5	15	25
f(x)	6	8	10	12	5

The value of the integral  $\int f(x) dx$  using Simpson's  $1/3^{rd}$  rule is \_\_\_\_\_. (round off to 1 decimal place).

#### **Answer:** (241.6)

52. Consider a vertically falling film of water over an impermeable wall. The film is in contact with a static pool of non –reactive pure gas. The gas diffuses into the water film over the entire height of the falling film. The height of the film is 1.0m and its thickness is  $10^{-4}$  m. The velocity of water, average over the film thickness, is 0.01ms<sup>-1</sup>. The gas concentration (in kg m<sup>-3</sup>), averaged over the film thickness is

 $\overline{\mathbf{C}_{\mathbf{A}_{\mathbf{y}}}} = \mathbf{C}_{\mathbf{A}_{\mathbf{i}}} \left( 1 - \mathbf{e}^{-30\mathbf{y}} \right)$ 

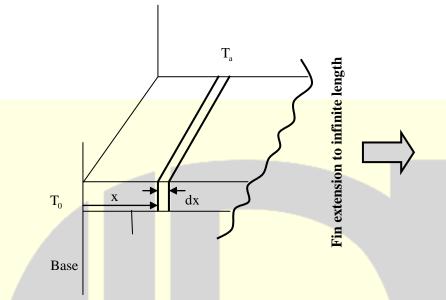

Where y is the vertical position in meters measured from the top of the wall. In addition, use the following data and assumptions.

- The flow is fully developed
- The width of the film is much larger than the thickness of the film, and the dissolved gas concentration is invariant over the width.
- The solubility of the gas in water,  $C_A$ , is constant
- Pure water enters at y=0
- The evaporation of water is negligible.

The mass transfer coefficient on the liquid side (in  $mm s^{-1}$ ), averaged over the entire height of the falling film is \_\_\_\_\_ (round off to 3 decimal places).

#### **Answer:** (0.03)

53. Consider the infinitely long rectangular fin exposed to a surrounding fluid at a constant temperature  $T_a = 27^{\circ}C$ 

The steady state one dimensional energy balance on an element of the fin of thickness dx at a distance x from its base yields.

$$\frac{d^2\theta}{dx^2} = m^2\theta$$

Where  $\theta = T_x - T_a$ ,  $T_x$  is the temperature of the fin at the distance x from its base in °C. The value of m is 0.04 cm<sup>-1</sup> and the temperature at the base is  $T_0 = 227$  °C. The temperature (in °C) at x= 25 cm is \_\_\_\_\_\_ round off to 1 decimal place).

\_\_\_\_\_

#### **Answer:** (100.5)

54. Consider the gas phase reaction  $N_2O_4 \rightleftharpoons 2NO_2$  occurring in an isothermal and isobaric reactor maintained at 298 K and 1.0 bar. The standard Gibbs energy change of the reaction at 298 K is  $\Delta G_{298}^{\circ} = 5253 \text{Jmol}^{-1}$ . The standard states are those of pure ideal gases at 1.0 bar. The equilibrium mixture in the reactor behaves as an ideal gas. The value of the universal gas constant is 8.314 J mol}{-1}K^{-1}. If one mole of pure  $N_2O_4$  is initially charged to the reactor the fraction of  $N_2O_4$  that decomposes into  $NO_2$  at equilibrium is

(A) 0.17 (B) 0.38 (C) 0 (D) 1
